

SELECT Feed Logger

Technical data

THE SELECT FEED LOGGER is designed to address the problem of – How much feed is left in the silo (feed bin)?

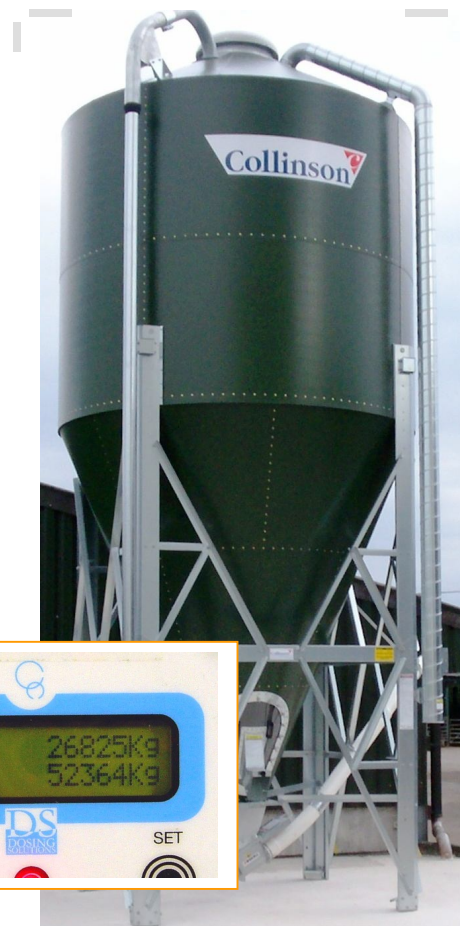

Knowing how much feed remains in a silo is critical. An unexpectedly empty silo has serious welfare implications, as well as placing strain on the supply company which has to deliver feed at short notice.

Features include:

- Easy calibration – All feeds have a different compositions and hence a different performance in augers. The Select Feed Logger has a 1 minute calibration procedure that is accurate as well as fast.
- Daily usage rate is shown for each auger as well as the quantity remaining in the silo.
- Up to 6 augers can be connected by cable to one Select Feed Logger. Each can be calibrated separately.
- Where multiple augers feed from the same silo, these augers can be linked to give an accurate picture of what remains in the common silo.
- Where one or more augers service multiple silos, those augers can simply be re-linked to suit the silo feeding them.
- Installation is quick and simple. Full instructions given in the Instructions for Use.
- Single button push to get to “Add Delivery” screen for each silo.

Coming soon:

The Select Feed Logger will be able to be connected to the General-Alert system. More details soon....
